

# Need A Reason To Consider Micro Filtration?

## We Have Millions Of Them!

Transmission fluid contamination doesn't need to be a fact of life. EP NTZ Micro Filtration systems captures millions of the smallest particles in transmission fluid. Our finest filters are 99.97% efficient at 2 micron and larger particles, and others can be designed for any filtering goal. The reason is our trademarked filter element that uses a cellular construction to trap more and smaller particles than possible with the typical inline filter. In OE applications, this particle-free performance can mean extended life for transmission components and fluid, along with improved shifting.

Our micro filters have been proven on Formula 1 transmissions, and are on the world's best-performing passenger cars and fleet vehicles. That same level of performance can be a reality in your transmissions.

There are millions of reasons to eliminate transmission fluid contamination. And only one company that can do it – EP NTZ Micro Filtration.
